RESEARCH OVERVIEW / VERSION 1.0.0 / OCTOBER 2026

Beyond the LLM Boundary

Structural Hybrid Intelligence, Representation Barriers, and the Future of AI Architecture

Sizhe Tan & GPT-Obot | Eight-paper conceptual research collection

Central thesis

A universal language interface does not imply a universally optimal internal architecture. Different tasks may require distinct representations, execution engines, evidence standards, ownership boundaries, and governance controls.

BASHI: Boundary-Aware Structural Hybrid Intelligence

Task & boundary profiling → Structural localization → Authorized hybrid execution → Evidence / counter-evidence verification → Governed structural growth

The eight research papers

BLB-001	Language Intelligence and the Limits of Universal Coverage
BLB-002	Computational Representation Barriers Beyond Natural Language
BLB-003	The Economics of LLM Scaling and Structural Specialization
BLB-004	Perspective Sovereignty, Ownership, and the All-in-One Boundary
BLB-005	Decoupling Structural Localization from Per-Node Intelligence
BLB-006	CCC-Native Intelligence and Structural Semantic Units
BLB-007	BASHI: Boundary-Aware Structural Hybrid Intelligence Architecture
BLB-008	From LLM Boundaries to Open-Ended Structural Intelligence Growth

Research status and access

This release presents hypotheses, formal distinctions, architecture proposals, and falsifiable evaluation plans. It does not claim demonstrated superiority over LLM-only, LLM-with-tools, or conventional hybrid baselines.
